

ENTERPRISE CASE STUDY

Quest Intelligence

Event Reporting System

MY ROLE

UI/UX Designer

DOMAIN

Oil and Gas

PROJECT TYPE

Enterprise Web App

DURATION

7 months

PROJECT TEAM

- Product Owner
- Business Analyst
- Developers
- QA Team
- UI/UX Designer

EVENT REPORTING SYSTEM CASE STUDY

01 / CONTEXT & RESPONSIBILITIES

Project Overview

Background

This enterprise web application was used in the Oil & Gas industry, where safety and compliance are critical.

This application helped field employees to report an event:

- Safety incidents
- Near misses
- Vehicle accidents
- Environmental spills
- Operational events

My Contribution

- Workflow Analysis**
Understood reporting processes and business requirements.
- Visual Design**
Designed intuitive screens for faster and easier reporting.
- AGIES Design System**
Used existing AGIES components to maintain consistency.

Goal

Revamp the legacy platform and migrate it to Angular while keeping global reporting workflows intact.

EVENT REPORTING SYSTEM CASE STUDY

02 / METHODOLOGY

UX Process Followed

Because this was an enterprise revamping project, the focus was improving user experience without changing existing business processes.

PHASE 01

Discover

Research & Requirements Alignment

- Reviewed existing business requirements & operational workflows
- Built an alignment map of the incident reporting lifecycle
- Analyzed user task sequences and system validation rules

PHASE 02

Define

Analysis & Information Mapping

- Identified key usability bottlenecks and data-entry errors
- Prioritized critical safety activities & high-priority triggers
- Mapped user journeys for field operators and office compliance officers

PHASE 03

Design

System UI & Layout Architecture

- Drafted responsive wireframes for desktop & mobile device
- Developed high-fidelity UI using the AGIES Design System constraints
- Reorganized page layouts to expose primary metadata fields instantly
- Standardized form controls, validation states, and accessibility patterns
- Prepared a component library and layout guidelines for future iterations

PHASE 04

Validate

Handoff & Execution Support

- Facilitated structured walkthroughs and feedback iterations
- Conducted deep stakeholder design review sessions
- Partnered directly with developers for pristine design translation
- Documented edge cases, error handling, and accessibility considerations
- Finalized handoff assets and supported implementation QA checkpoints

EVENT REPORTING SYSTEM CASE STUDY

03 / DISCOVER

Requirements & Workflow Understanding

Collaborated with Product Owners and Business Analysts to understand business requirements, compliance needs, and safety supervisor workflows.

QUEST INTELLIGENCE: CORE REPORTING LIFECYCLE

01 Event Creation > 02 Incident Details > 03 Classification > 04 Classification Details > 05 Review summary > 06 Report Submission

John Carter
Field Safety Supervisor

BIO

John Carter is a Field Safety Supervisor responsible for managing and reporting workplace incidents across field operations. He coordinates investigations, ensures compliance with safety standards, and submits accurate reports to help maintain a safe working environment and reduce operational risks.

"I need a simple and reliable reporting process so I can document incidents quickly, accurately, and without missing critical details."

RESPONSIBILITIES

- Report safety incidents and near misses
- Document investigation details
- Ensure reporting compliance
- Submit accurate reports on time

GOALS

- Complete reports quickly
- Avoid missing critical information
- Track incidents efficiently
- Maintain data accuracy

PAIN POINTS

- Large amount of information to enter
- Multiple reporting stages
- Complex forms and workflows
- Risk of incomplete reporting

EVENT REPORTING SYSTEM CASE STUDY

03 / DEFINE

User Journey Mapping

01

STAGE

Event Creation

ACTION
Creates a new incident/event report

PAIN POINT
Unsure where to start and what information is required

DESIGN OPPORTUNITY
Provide clear entry points, guidance, and event selection

02

STAGE

Incident Details

ACTION
Enters event information, location, date, people involved, and supporting details

PAIN POINT
Large forms and repetitive data entry increase effort

DESIGN OPPORTUNITY
Organize information into logical sections and improve form hierarchy

03

STAGE

Classification

ACTION
Selects event category, type, and reporting classifications

PAIN POINT
Multiple categories and dependencies make selection difficult

DESIGN OPPORTUNITY
Simplify classification flow and provide contextual guidance

04

STAGE

Classification Details

ACTION
Completes additional questions based on selected classification and determines report severity

PAIN POINT
Dynamic fields and compliance requirements can be overwhelming

DESIGN OPPORTUNITY
Show only relevant fields and improve visibility of critical information

05

STAGE

Review Summary

ACTION
Reviews all entered information before submission

PAIN POINT
Difficult to verify completeness and identify missing information

DESIGN OPPORTUNITY
Present a consolidated summary with validations and error highlighting

06

STAGE

Report Submission

ACTION
Submits the report into the system workflow

PAIN POINT
Lack of confidence that submission was successful

DESIGN OPPORTUNITY
Provide confirmation, status visibility, and next-step guidance

OUTCOME

- ✓ Simplifying complex workflows
- ✓ Improving information hierarchy
- ✓ Making forms easier to complete
- ✓ Supporting accurate incident reporting
- ✓ Improving navigation across stages

EVENT REPORTING SYSTEM CASE STUDY

04 / DESIGN SYSTEM STANDARDS

AGIES Design System Integration

Instead of creating a new design system, I leveraged client's pre-established global AGIES Design System to ensure corporate compliance, baseline consistency, and extremely fast implementation timelines.

- Applied AGIES Components and Patterns**
Reused standard client's enterprise form-inputs, layouts, state indicators, and feedback loops directly.
- Maintained Consistency Across Screens**
Guaranteed identical typographic scaling, margins, color usage, and spatial rhythm across all Angular templates.
- Supported Angular Implementation**
Collaborated directly with Angular developers to map Figma component props directly to the Angular component library.
- Participated in Design Reviews**
Actively presented iterative modernizations during regular global stakeholder feedback sessions.

EVENT REPORTING SYSTEM CASE STUDY

05 / DESIGN DECISIONS

UX Considerations Behind the Redesign

The redesign focused on reducing user effort, improving information access, and supporting users throughout the reporting lifecycle.

Reduced User Friction

Frequently used actions were placed directly on the dashboard, allowing users to start the incident reporting process without navigating through multiple screens.

Reduced Cognitive Load

Related information was grouped into logical sections, making complex forms easier to understand and complete.

Improved Decision-Making

Important reporting metrics were prioritized at the top of the page, helping users quickly assess system status and determine next actions.

Workflow-Oriented Design

The experience was structured around the reporting lifecycle, enabling users to progress through tasks in a predictable and intuitive manner.

Design System Consistency

Existing AGIES components and patterns were used to create a familiar experience while ensuring consistency across modules.

EVENT REPORTING SYSTEM CASE STUDY

06 / SOLUTION

Designs

Using the AGIES Design System, I designed user interfaces that aligned meticulously with corporate compliance standards while vastly improving usability, data entry speeds, and workflow orientation.

07 / PROJECT OUTCOME

Outcome & Key Learnings

Project Success Metric

Quest Intelligence was successfully revamped into a modern Angular-based enterprise application while retaining essential safety workflows used globally across various deep oil and gas operation sites.

CORE DESIGN TAKEAWAYS & KEY LEARNINGS

01

Safety-Critical Design

Learned to manage extreme operational risks by ensuring mandatory data entry points are visually unavoidable.

02

Complex Workflows

Successfully mapped non-linear, multi-stage enterprise compliance steps into simple interface loops.

03

Business Alignment

Maintained critical trade-offs between rigorous regulatory compliance and optimal operator data entry speed.

04

Design System Play

Maximized leverage of corporate AGIES constraints to drastically shorten developer delivery timelines.

05

Scalable Experience

Designed interfaces with responsive strategies for both modern office setups and robust field mobile.
